

I have a quarto blog website. I want to create hyperlink to external markdown files which are stored in a folder called `ai-english`. so that when I click on a link, it should redirect me to a linked markdown file. how to achieve this?

Gemini 3.5 Thinking

To link to external Markdown files within your Quarto blog, the method depends on whether you want Quarto to **render those Markdown files into HTML pages** or if you just want to link to the **raw, unrendered .md files** for people to view or download.

Here is how you can achieve both approaches.

Method 1: Render the Markdown files as HTML pages (Recommended)

Quarto is smart. If you link to a `.md` or `.qmd` file using relative paths, Quarto will automatically compile that file into an HTML page and update the hyperlink to point to the `.html` version in the final website.

1. Check your folder structure

Assume your Quarto project looks something like this:

text

```
my-quarto-blog/
├── _quarto.yml
├── index.qmd
├── ai-english/
│   ├── guide.md      <-- The file you want to link to
│   └── posts/
│       ├── my-blog-post/
│       └── index.qmd  <-- The post where you are writing the link
```

2. Use relative paths

Because blog posts are usually nested inside a `posts/post-name/` directory, you need to use `../` to step out of those folders and reach the `ai-english` folder at the root.

Inside your blog post (`posts/my-blog-post/index.qmd`), write the link like this:

markdown

Check out our [\[AI English Guide\]\(../../ai-english/guide.md\)](#).

- `../` takes you out of `my-blog-post`
- The second `../` takes you out of `posts`
- `ai-english/guide.md` points to your target file.

When you run `quarto preview` or `quarto render`, Quarto will automatically convert `../../ai-english/guide.md` into `../../ai-english/guide.html` behind the scenes.

Method 2: Link to the raw, unrendered `.md` files

If you don't want Quarto to turn those Markdown files into web pages, and you instead want visitors to see or download the literal, raw text file, you have to tell Quarto not to render them, but to copy them over to the final site assets.

1. Update your `_quarto.yml`

You need to add the `ai-english` folder to the `resources` option in your project configuration. This tells Quarto to copy the folder exactly as it is into the output directory.

Open your `_quarto.yml` file and add:

yaml

```
project:
  type: website
  resources:
    - "ai-english/"
```

2. Write the link

Now, write the relative link exactly the same way as before inside your blog post:

markdown

Download the [\[Raw Markdown File\]\(../../ai-english/guide.md\)](#).

Because of the `resources` setting, Quarto will leave the `.md` extension alone, allowing users to access the raw file directly when they click the link.

Which of these two methods fits what you are trying to do with your `ai-english` folder?
